

RealObjects edit-on Pro is a cross-platform XHTML/XML WYSIWYG editor as a Java Applet, allowing individuals and teams to update, create, and publish Web content within Content Management, Knowledge Management, e-Learning or other Web-based systems. The component is also available as a JavaBean (edit-on JavaBean SDK), which enables developers to quickly integrate comprehensive and robust rich text authoring functionality into Java Swing-based desktop applications.

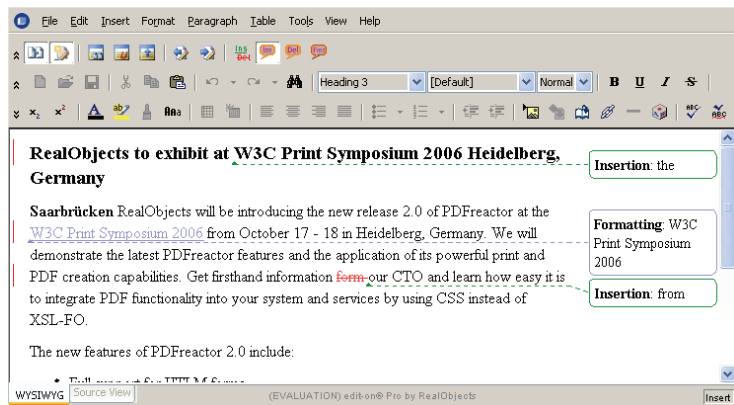

The editor has an easy-to-use, intuitive user interface which provides word processor-like and XML editor-like features to web based applications. It significantly increases the productivity of your authors while empowering non-technical users to become content contributors without having to learn HTML or XML.

It guarantees XHTML compliance of the contents created or pasted from other applications by validation. Thus corporate site standards for style, layout and code can uncompromisingly be enforced. The valid XHTML output assures portability, compatibility and interoperability.

RealObjects edit-on Pro 5 is the newest version of the leading editor from RealObjects which is used by more than 1500 companies and institutions worldwide. The highlights of the new version are the optional VersioTrack add-on and the improved JavaScript API, which enables the seamless integration with AJAX technology.

VersioTrack add-on: compare document versions and track changes

The new VersioTrack add-on enables content contributors and reviewers to reliably identify and visualize differences between document versions and track content changes in real-time in a content creation workflow. It provides a very user friendly way to accept and reject changes on a finely grained basis.

VersioTrack works seamlessly within edit-on Pro, making it the world's first online HTML WYSIWYG editor control which provides both document comparison and track changes functionality – right within the editor environment.

The combination of edit-on Pro and VersioTrack is the perfect solution to enhance the productivity of content contributors and allows new innovative possibilities in Web-based content workflows.

What's new in Version 5?

- Optional VersioTrack add-on to compare document versions and track document changes
- Compatibility with Prototype JavaScript Library for seamless integration with AJAX technology
- Dynamic hiding and resizing of editor using JavaScript API, e.g. hide editor during loading, special effects using AJAX technology
